

# Computer Parts

## 1. CPU

*It's basically the memory of the computer, if you don't have one then... you don't have a computer..*

## 2. RAM

*It's the storage of your computer, you need one. There's 2 types of RAM, SATA AND DDR, DDR RAM is faster and SATA is slower but both are up to you.*

## 3. Motherboard

*Everyone of these parts i'm gonna tell are getting stored inside of the motherboard. It's in the name*

the "mother" board.

#### 4. CPU Cooler

The CPU occasionally gets a little too hot.. so you use a CPU Cooler. It cools your CPU down to at least 30 - 40 degrees celsius.

#### 5. The Case

The case keeps everyone of these parts inside safe. You don't need to waste your money on one, you can actually just use a cardboard box or don't even have one just the motherboard and the parts.

#### 6. The GPU

The good old graphics card, it

Loads your graphics into your monitor and you either have a big one that looks like a tank or one that looks like a CPU, the one that looks like a CPU is called integrated graphics.

## 7. The PSU

The power supply, all of those parts get power from that one you plug it in to a wall and you have power!

## 8. The WI-FI Antenna

Some of your motherboards have build-in WI-FI antennas (i know it sounds normal but for 80% of motherboards don't have one) If you don't have one you can use either

## *Ethernet or Wireless Wi-Fi USB'S*

### *9. Ethernet*

*Ethernet is the best Wi-Fi source you can use. It uses a cable called an Cat cable and connects from your PC to your Wi-Fi Router.*

### *10. Wireless Wi-Fi USB*

*The one that i actually use is a USB Stick that connects to your computers USB slot and gives it Wi-Fi. It's basically what the motherboard could have done, but you remove it any time you want.*

*THANK YOU FOR  
EITHER SKIPPING THIS OR READING THIS*
